Recent authors, Ferguson (1971), Riotte & Peigler (1980), offer no information regarding number of broods of *Anisota stigma* (Fabricius) in the southern United States. Only Ferguson (1971) makes the statements "In the northern part of the range there is only one brood..." "Dates for Florida from June to October."

In Louisiana *stigma* has been commonly collected using ultraviolet light traps by this author for over 20 years. Fig. 1 clearly shows that specimens have been taken May through September in Louisiana; 98% in July-August, the single brood peaking end of July.

Fig. 1. Dates of capture *Anisota stigma* at sec.24T6SR12E, 4.2 mi. NE Abita Springs, Louisiana (1990–96), n=3088.
